

Closing

In view of the foregoing, the entire application is believed to be in condition for allowance, and such action is respectfully requested at the Examiner's earliest convenience. If, in the opinion of the Examiner, an interview would expedite prosecution of this application, the Examiner is invited to call the undersigned attorney at the telephone number shown below.

Respectfully submitted,

Dated: July 24, 2002

14      Title of the Invention  
15

16      Multiple Cache Communication

17

18      Background of the Invention

19

20      *I. Field of the Invention*

21

22      This invention relates to caches.

1    2.    *Related Art*

2

3                 In a computer system in which client devices request information from one  
4    or more server devices, it is sometimes desirable to provide a cache; that is, a device that  
5    maintains copies of requested information so multiple requests for the same information  
6    can be satisfied at the cache. When requests for information are satisfied at the cache, the  
7    server devices need not receive the requests, process them, and retransmit the same in-  
8    formation over a communication channel that links the client devices and the server de-  
9    vices. For example, the server devices can be web servers, the client devices can be web  
10   clients, the communication channel can be an IP network such as the Internet, and the re-  
11   quested information can be web objects.

12

13                 Some information requested from the server devices is considered not  
14    cacheable, for one or more of several reasons. As examples, the server can refuse to allow  
15    the information to be cached, or the information can be a result of a dynamic process that  
16    can provide differing results for the same request (so caching would obviate the operation  
17    of that dynamic process). An example of dynamically processed information could in-  
18    clude advertisements, database searches, or output from CGI scripts.

19

20                 However, it often occurs that non-cacheable information is requested a sec-  
21    ond time without having changed, so the second request to the server results in identical  
22    information being returned. In a system with multiple communicating caches, transmit-

ting the same information from a first cache to a second cache (when each already has a copy) is an inefficient use of communication resources.

3  
4        Accordingly, it would be desirable to provide a method and system for op-  
5 erating a set of multiple communicating caches, in which transmission of repeated infor-  
6 mation is substantially reduced or eliminated. A first aspect of the invention is to main-  
7 tain information at each cache to improve the collective operation of multiple communi-  
8 cating caches. A second aspect of the invention is to substantially reduce the amount of  
9 information transmitted between multiple communicating caches. A third aspect of the  
10 invention is to refrain from unnecessarily transmitting the same data from a first cache to  
11 a second cache when the latter already has a copy.

## Summary of the Invention

14  
15                 The invention provides a method and system for operating a set of multiple  
16         communicating caches. Between caches, unnecessary transmission of repeated informa-  
17         tion is substantially reduced

18  
19           In a first aspect of the invention, each cache maintains information to im-  
20 prove the collective operation of the system of multiple communicating caches. This can  
21 include information about the likely contents of each other cache, or about the behavior of  
22 client devices or server devices coupled to other caches in the system.

1  
2        In a second aspect of the invention, pairs of communicating caches sub-  
3 stantially compress transmitted information. This includes both compression in which the  
4 receiving cache can reliably identify the compressed information in response to the mes-  
5 sage, and compression in which the receiving cache will sometimes be unable to identify  
6 the compressed information.

7  
8        In a third aspect of the invention, a first cache refrains from unnecessarily  
9 transmitting the same information to a second cache when each already has a copy. This  
10 includes both maintaining a record at a first cache of information likely to be stored at a  
11 second cache, and transmitting a relatively short identifier for that information in place of  
12 the information itself.

13  
14        In a preferred embodiment, a set of caches are disposed in a directed graph  
15 structure, with a set of root caches disposed for coupling to server devices and a set of  
16 leaf caches disposed for coupling to client devices. Both root caches and leaf caches  
17 store non-cacheable objects beyond their initial use, along with relatively short identifiers  
18 for the non-cacheable objects. When a server device returns identical information to a  
19 root cache in response to a request for a non-cacheable object, that root cache transmits  
20 only the identifier of the non-cacheable object to the requesting leaf cache, avoiding re-  
21 transmitting the entire object if the leaf cache still has the object.

22

1           Brief Description of the Drawings

2

3           Figure 1 shows a block diagram of a system having multiple caches.

4

5           Figure 2 shows a process flow diagram for a method of using a system  
6       having multiple caches.

7

8           Detailed Description of the Preferred Embodiment

9

10          In the following description, a preferred embodiment of the invention is de-  
11       scribed with regard to preferred process steps and data structures. Those skilled in the art  
12       would recognize after perusal of this application that embodiments of the invention can  
13       be implemented using one or more general purpose processors or special purpose proces-  
14       sors or other circuits adapted to particular process steps and data structures described  
15       herein, and that implementation of the process steps and data structures described herein  
16       would not require undue experimentation or further invention.

17

18          Inventions disclosed herein can be used in conjunction with inventions dis-  
19       closed in one or more of the following patent applications:

20

1 o Provisional U.S. Application 60/048,986, filed June 9, 1997, in the name of in-  
2 ventors Michael Malcolm and Robert Zarnke, titled "Network Object Cache En-  
3 gine", assigned to CacheFlow, Inc., attorney docket number CASH-001 (P).

4

5 o U.S. Application Serial No. 08/959,058, filed October 28, 1997, in the name of in-  
6 ventors Michael Malcolm and Ian Telford, titled "Adaptive Active Cache Re-  
7 fresh", assigned to CacheFlow, Inc., attorney docket number CASH-003.

8

9 o U.S. Application Serial No. 08/959,313, filed October 28, 1997, in the name of in-  
10 ventors Doug Crow, Bert Bonkowski, Harold Czegledi, and Tim Jenks, titled  
11 "Shared Cache Parsing and Pre-fetch", assigned to CacheFlow, Inc., attorney  
12 docket number CASH-004.

13

14 o U.S. Application Serial No. 09/093,533, filed June 8, 1998, in the name of inven-  
15 tors Michael Malcolm and Robert Zarnke, titled "Network Object Cache Engine",  
16 assigned to CacheFlow, Inc., attorney docket number CASH-001.

17

18 and

19 o PCT International Application PCT/US 98/11834, filed June 9, 1997, in the name  
20 of assignee CacheFlow, Inc., and inventors Michael Malcolm and Robert Zarnke,  
21 titled "Network Object Cache Engine", attorney docket number CASH-001 PCT.

5        *System Elements*

6

7        Figure 1 shows a block diagram of a system having multiple caches.

8

9        A system 100 includes a cache system 110, at least one client device 120,  
10      and at least one server device 130.

11

12      Client Device

13

14        Each client device 120 is coupled to the cache system 110 using a client  
15      communication path 121. The client communication path 121 can include a dial-up con-  
16      nection, a LAN (local area network), a WAN (wide area network), an ATM network, an  
17      IP network (such as an internet, intranet, or extranet), or some combination thereof. In a  
18      preferred embodiment, the client communication path 121 includes a dial-up connection,  
19      such as for coupling a subscriber to an ISP (internet service provider), or a LAN, such as  
20      for coupling a workstation to an internet connection.

21

1           As used herein, the terms “client” and “server” refer to relationships be-  
2       tween the client or server and the cache [110], not necessarily to particular physical de-  
3       vices.

4

5           As used herein, the term “client device” includes any device taking on the  
6       role of a client in a client-server environment. There is no particular requirement that the  
7       client devices [110] 120 must be individual devices; they can each be a single device, a  
8       set of cooperating devices, a portion of a device, or some combination thereof.

9

10          Server Device

11

12          Each server device 130 is also coupled to the cache system 110 using a  
13       server communication path 131. The server communication path 131 can include a dial-  
14       up connection, a LAN (local area network), a WAN (wide area network), an ATM net-  
15       work, an IP network (such as an internet, intranet, or extranet), or some combination  
16       thereof. In a preferred embodiment, the server communication path 131 includes an  
17       internet backbone and an internet connection between the cache system 110 and the inter-  
18       net backbone.

19

20          As used herein, the term “server device” includes any device taking on the  
21       role of a server in a client-server environment. There is no particular requirement that the

1 server devices 130 must be individual devices; they can each be a single device, a set of  
2 cooperating devices, a portion of a device, or some combination thereof.

3

4 The server device 130 includes memory or storage 132 for recording one or  
5 more web objects 133. The web objects 133 can include any type of data suitable for  
6 transmitting to the client device [110] 120, such as the following:

7

8 o text, color, formatting and directions for display;

9

10 o pictures, data in graphical formats (such as GIF or JPEG), other multimedia data;

11

12 o animation, audio (such as streaming audio), movies, and video (such as streaming  
13 video), and other data in audio or visual formats (such as MPEG);

14

15 o program fragments, including applets, Java, JavaScript, and ActiveX; and

16

17 o other web documents (such as when using frames);

18

19 and

20 o other data types (such as indicated by future extensions to HTML, DHTML,  
21 SGML, XML, or similar languages).

22

1 / / /

2

3

4 Cache System

5

6 The cache system 110 includes a set of caches 111. The set of caches 111  
7 comprises a variety of caches, preferably including root caches, leaf caches, intermediate  
8 caches and individual caches. Each cache 111 is designated a “leaf cache” if it is coupled  
9 to one or more client communication paths 121, and is designated a “root cache” if it is  
10 coupled to one or more server communication paths 131. The cache system 110 includes  
11 an inter-cache communication path 112 for communication between and among caches  
12 111.

13

14 The inter-cache communication path 112 can include a plurality of direct  
15 connections, a LAN (local area network), a WAN (wide area network), an IP network  
16 (such as an internet), or some combination thereof. In a preferred embodiment, the inter-  
17 cache communication path 112 includes a plurality of direct connections between pairs of  
18 individual caches 111.

19

20 In a preferred embodiment, the caches 111 in the cache system 110 are dis-  
21 posed in a graph structure. One or more leaf caches 111 are coupled to client communi-  
22 cation paths 121, and one or more root caches 111 coupled to one or more server commu-

1 nication paths 131. Where appropriate, a set of intermediate caches 111 are coupled to  
2 the leaf caches 111 and to the root caches 111.

3

4 110 disposed for use with an ISP (internet service provider), there is one root cache 111  
5 coupled to an internet backbone, and there is one leaf cache 111 for each POP (point of  
6 presence). In this example, the inter-cache communication path 112 includes direct con-  
7 nections (such as T1 or T3 connections) between the root cache 111 and each leaf cache  
8 111.

9

10 Cache Devices

11

12 Each cache 111 includes a processor, program and data memory, and mem-  
13 ory or storage [112] 114 for recording one or more web objects 133. Each cache 111 re-  
14 tains the web objects 133 for repeated serving to client devices 120 in response to web  
15 requests.

16

17 In a preferred embodiment, each cache 111 includes a router-switch 113,  
18 for receiving messages and distinguishing types of messages that should be processed by  
19 the cache 111 from those that should not. For example, the router-switch 113 can divert  
20 all requests using FTP (file transfer protocol) or HTTP (hypertext transfer protocol) to the  
21 cache 111 for processing, while passing through other types of requests unchanged.

22

1           In a preferred embodiment, each cache 111 includes a cache device such as  
2 described in the Cache Disclosures, hereby incorporated by reference as if fully set forth  
3 therein, and is disposed for operating as described therein.

4        Multiple Cache Communication

5

6           Each leaf cache 111 receives requests from client devices 120 for web ob-  
7 jects 133. The web objects 133 might be cacheable or non-cacheable.

8

9           If a client device 120 requests a cacheable web object 133, the leaf cache  
10 111 might already have the requested web object 133 in its memory or storage [112] 114.  
11 If so, the leaf cache 111 serves the requested web object 133 to the client device 120  
12 without having to request the web object 133 from the root cache 111 or from the server  
13 device 130. If the leaf cache 111 does not already have the requested web object 133, the  
14 leaf cache 111 requests it from the root cache 111.

15

16          The root cache 111 performs a similar caching function, returning the re-  
17 quested cacheable web object 133 directly to the leaf cache 111 if it is already present in  
18 its own memory or storage [112] 114, without having to request that web object 133 from  
19 the server device 130. If the root cache 111 does not already have the requested web ob-  
20 ject 133 in its memory or storage [112] 114, the root cache 111 requests it from the server  
21 device [120] 130.

22

1           If the leaf cache 111 and the root cache 111 do not already have a copy of  
2   the web object 133 in their respective memory or storage [112] 114, the root cache 111  
3   requests the web object 133 from the server device 120. Similarly, if the web object 133  
4   is considered not cacheable, the root cache 111 requests the web object 133 from the server de-  
5   vice 120 whether or not it has already that web object 133 in their respective memory or  
6   storage [112] 114. The server device [120] 130 receives the request and returns the re-  
7   quested web object 133 to the root cache 111.

8

9   Objects Already in Storage

10

11           The root cache 111 receives the requested web object 133 from the server  
12   device [110] 130, records it in its memory or storage [112] 114, and determines an object  
13   signature 134 for the web object 133. In a preferred embodiment, the root cache 111  
14   computes the object signature 134 itself. In alternative embodiments, the server device  
15   [120] 130 may compute and record the object signature 134 and transmit it to the root  
16   cache 111 with the web object 133.

17

18           In a preferred embodiment, the object signature 134 includes an MD5 digest  
19   of the web object 133. In alternative embodiments, the object signature 134 may com-  
20   prise a CRC, MD4, SHA, or other known function of the web object 133.

21

1           There is no particular need for any device to be able to recover the web ob-  
2       ject 133 a priori from the object signature 134. It is sufficient that the root cache 111 or  
3       the leaf cache 111 can determine, in response to the object signature 134, if the web ob-  
4       ject 133 is present in its memory or storage [112] 114, and if so, which web object 133  
5       corresponds to that object signature 134.

6

7           If the web object 133 is cacheable but was requested from the server device  
8       [110] 130, the request from the server device [120] 130 was due to a cache miss. How-  
9       ever, it can still occur that the leaf cache 111 (or some intermediate cache 111) already  
10      has the web objects 133 in its memory or storage [112] 114, such as recorded in associa-  
11      tion with a different URL (uniform resource locator) or other identifier. In a preferred  
12      embodiment, each cache 111 records web objects 133 in association with the URL used  
13      to request those web objects 133.

14

15           For a first example, multiple server devices [120] 130 can record mirror  
16      copies of identical web objects 133. For a second example, non-identical web objects 133  
17      can include identical embedded web objects 133 (such as common graphics, animation, or  
18      program fragments).

19

20           If the web object 133 is considered non-cacheable, it was requested from  
21      the server device [120] 130 because non-cacheable web objects 133 are not meant to be  
22      served from the cache 111. However, it can still occur that the leaf cache 111 (or some

1 intermediate cache 111) already has the web objects 133 in its memory or storage [112]  
2 114, because the non-cacheable web object 133 had been requested earlier.

3  
4 For a first example, if the web object 133 is responsive to a CGI script or  
5 database search, it can be identical to the results of an earlier response to that CGI script  
6 or database search. For a second example, if the web object 133 is determined dynami-  
7 cally by the server device 130 (such as randomly selected advertisements), it can be iden-  
8 tical to an earlier advertisement transmitted by the server device 130.

9  
10 The root cache 111 transmits the object signature 134 to the leaf cache 111.  
11 The leaf cache 111 determines, in response to the object signature 134, whether it already  
12 has the associated web object 133 in its memory or storage [112] 114 and if so, which one  
13 is the associated web object 133. If so, the leaf cache 111 serves the associated web ob-  
14 ject 133 to the client device 120 from its memory or storage [112] 114 without the root  
15 cache 111 having to actually transmit the entire web object 133. If not, the root cache 111  
16 transmits the actual web object 133 to the leaf cache 111, which can then serve it to the  
17 client device 120.

18  
19 In a preferred embodiment, the root cache 111 includes a bitmap [114] 115  
20 in its memory or storage [112] 114 for each non-cacheable web object 133, including one  
21 bit [115] 116 for each leaf cache 111. Each bit [115] 116 of the bitmap [114] 115 indi-  
22 cates whether its associated leaf cache 111 has a copy of the web object 133.

1  
2       The root cache 111 directly transmits the actual web object 133 to the leaf  
3       cache 111 if the associated bit [115] 116 of the bitmap [114] 115 indicates that the leaf  
4       does not have the web object 133. If the bit [115] 116 indicates that the leaf cache 111  
5       does have the web object 133, the root cache 111 attempts to transmit only the object sig-  
6       nature 134. However, even if the bit [115] 116 indicates that the leaf cache 111 does  
7       have the web object 133, it may occur that the leaf cache 111, being a cache, has dis-  
8       carded the web object 133 in the interim. In this case, the leaf cache 111 so indicates and  
9       re-requests the web object 133 from the root cache 111.

10  
11       In a preferred embodiment, when the root cache 111 transmits the object  
12       signature 134 to the leaf cache 111, it so indicates using a data type, such as a MIME  
13       type, or a new type of object, indicating that the transmission includes only the object sig-  
14       nature 134.

15  
16       Compression for Transmission

17  
18       When transmitting actual web objects 133 between caches 111 (such as  
19       from the root cache 111 to the leaf cache 111), those web objects 133 are substantially  
20       compressed for transmission and decompressed after reception. Compression for trans-  
21       mission can be applied both to cacheable and to non-cacheable web objects 133.

22

1           Compression for transmission can include various techniques, such as  
2   Huffman coding, Liv-Zempel compression, or other known lossless compression. Com-  
3   pression for transmission can also include known lossy compression, such as JPEG,  
4   MPEG, or other audio and video codec techniques, when appropriate for the type of web  
5   object 133.

6

7           Those skilled in the art will recognize, after perusal of this application, that  
8   transmission of the object signature 134 in place of the actual web object 133 is a form of  
9   substantial compression. This form of compression is unreliable, in the computer science  
10   sense that the receiver is not guaranteed to be able to recover the web object 133 from its  
11   object signature 134. In fact, using this form of compression the leaf cache 111 can only  
12   do so if the web object 133 is already recorded in its memory or storage [112] 114.

13

14       Unreliable Dictionary Compression

15

16           As used herein, “dictionary compression” means a form of communication  
17   in which a sender and a destination each maintain a set of dictionary elements and a set of  
18   associated tag values, each tag value being representative of one of the dictionary ele-  
19   ments. There is no particular requirement that the dictionary elements can be recovered  
20   from their associated tag values without further information. Rather, dictionary compres-  
21   sion refers generally to a system in which the dictionary elements can be associated with  
22   arbitrary tag values.

1  
2       The sender and the destination each associate the same tag value with the  
3       same dictionary element. For example, the sender can transmit the dictionary element,  
4       along with an arbitrarily selected tag value, to the destination to make the association.  
5       Systems in which the sender does this, and the destination maintains a dictionary of such  
6       tag values in response thereto, are known in the art.

7  
8       As used herein, "unreliable" dictionary compression means that the desti-  
9       nation might possibly discard the association between the tag value and the dictionary  
10      element.

11  
12      In a preferred embodiment, each dictionary element includes a complete  
13      web object 133, and the tag value associated with each particular web object 133 is a  
14      known function of that particular web object 133. The known function is preferably an  
15      MD5 signature, as noted herein.

16  
17      In a preferred embodiment, the destination (because it is a cache) can dis-  
18      card any particular web object 133, and thus lose the association between that particular  
19      web object 133 and its MD5 signature. That is, the destination (because it has discarded  
20      the particular web object 133) can no longer determine if a particular MD5 signature is  
21      associated with any known web object 133. Moreover, the destination cannot determine  
22      the web object 133 in response to the MD5 signature without further information.

1  
2           Transmission of the object signature 134 in place of the actual web object  
3       133 is a form of dictionary compression in which the entire actual web object 133 is the  
4       dictionary element. If the leaf cache 111 has discarded that dictionary element, it requests  
5       the root cache 111 to retransmit the actual web object 133 using a second form of com-  
6       pression. For example, the second form of compression can include a known lossless  
7       compression technique such as Liv-Zempel compression or the form of compression used  
8       in the PKZIP product available from PKWare, Inc.

9  
10          Those skilled in the art will recognize, after perusal of this application, that  
11       unreliable dictionary compression is applicable in various other applications that can use  
12       compression. In a preferred embodiment, unreliable compression is acceptable because  
13       the root cache 111 can retransmit the web object 133 using a more reliable (but possibly  
14       less strong) compression technique.

15  
16          Other Web Object Information  
17  
18          The root caches 111 and the leaf caches 111 can also exchange other infor-  
19       mation about the web objects 133.

20  
21          In a preferred embodiment, the cache system 110 collectively maintains in-  
22       formation for each web object 133 regarding the following:

1  
2 o A probability the web object 133 in the cache system 110 will be next requested by  
3 some client device 120. This information will likely be best available at the leaf  
4 caches 111.

5  
6 and  
7 o A probability the web object 133 in the cache system 110 will be stale. This in-  
8 formation will likely be best available at the root caches 111.

9  
10 The cache system 110 can collectively determine from this information  
11 whether the web object 133 is the next web object 133 recorded by the cache system 110  
12 to be served state. As described in the Cache Disclosures, particularly attorney docket  
13 numbers CASH-003 and CASH-004, this information can be used to determine which  
14 web objects 133 to actively refresh.

15  
16 Active refresh can also be applied to frequently-requested non-cacheable  
17 web objects 133, and distributed within the cache system 110, even though those web  
18 objects 133 are re-requested from the server devices 120 each time. Active refresh is well  
19 suited to web objects 133 such as advertisements, news reports, stock quotes, weather re-  
20 ports, and the like.

21

1       The cache system 110 can also maintain information about each web object  
2       133 regarding at which cache 111 in the cache system 110 that web object 133 is re-  
3       corded. With this information, the root cache 111 can request cached web objects 133  
4       from one of the leaf caches 111, in addition to or instead of re-requesting the web objects  
5       133 from server devices 120.

6

7       *Method of Operation*

8

9       Figure 2 shows a process flow diagram for a method of using a system  
10      having multiple caches.

11

12      A method 200 is performed by the system 100, including the cache system  
13      110, the client devices 120, and the server devices 130.

14

15      At a flow point 210, one of the client devices 120 is ready to request a web  
16      object 133.

17

18      At a step 211, one of the client devices 120 sends a message to its associ-  
19      ated leaf cache 111 requesting a selected web object 133. The request message preferably  
20      uses the FTP or HTTP protocol, and includes a URL for the selected web object 133.

21

1           At a step 212, the leaf cache 111 determines if the web object 133 is cache-  
2       able or non-cacheable. If the web object 133 is cacheable, the method 200 proceeds with  
3       the next step. If the web object 133 is non-cacheable, the method 200 proceeds with the  
4       flow point 220.

5

6           At a step 213, the leaf cache 111 determines if the web object 133 is present  
7       in its memory or storage [112] 114. In a preferred embodiment, the leaf cache 111 makes  
8       this determination in response to the URL for the selected web object 133 included in the  
9       request from the client device 120. If the web object 133 is present, the method 200 pro-  
10      ceeds with the next step. If the web object 133 is not present, the method 200 proceeds  
11      with the flow point 220.

12

13           At a step 214, the leaf cache 111 serves the web object 133 to the client de-  
14      vice 120. The method 200 continues with the flow point 210.

15

16           At a flow point 220, the leaf cache 111 is unable to serve the web object  
17       133 from its memory or storage [112] 114, either because there has been a leaf cache miss  
18       or because the web object 133 is non-cacheable.

19

20           At a step 221, similar to the step 211, the leaf cache 111 sends a message to  
21      the root cache 111 requesting the web object 133.

22

1           At a step 222, similar to the step 212, the root cache 111 determines if the  
2    web object 133 is cacheable or non-cacheable. If the web object 133 is cacheable, the  
3    method 200 proceeds with the next step. If the web object 133 is non-cacheable, the  
4    method 200 proceeds with the flow point 230.

5  
6           At a step 223, similar to the step 213, the root cache 111 determines if the  
7    web object 133 is present in its memory or storage [112] 114. In a preferred embodiment,  
8    the root cache 111 makes this determination in response to the URL for the selected web  
9    object 133 included in the request from the client device 120. If the web object 133 is  
10   present, the method 200 proceeds with the next step. If the web object 133 is not present,  
11   the method 200 proceeds with the flow point 230.

12  
13          At a step 224, similar to the step 214, the root cache 111 transmits the web  
14    object 133 to the leaf cache 111. The method 200 continues with the flow point 210.

15  
16          At a flow point 230, the root cache 111 is unable to transmit the web object  
17    133 from its memory or storage [112] 114, either because there has been a root cache  
18    miss or because the web object 133 is non-cacheable.

19  
20          At a step 231, similar to the step 211, the root cache 111 sends a message to  
21    the indicated server device 130 requesting the web object 133. The request message pref-

1 erably uses the FTP or HTTP protocol, and includes a URL for the selected web object  
2 133.

3

4 At a step 232, the server device 130 transmits the web object 133 to the root  
5 cache 111.

6

7 At a step 233, the root cache 111 determines an object signature 134 for the  
8 web object 133.

9

10 At a step 234, the root cache 111 determines if the web object 133 is present  
11 in its memory or storage [112] 114. In a preferred embodiment, the root cache 111 makes  
12 this determination in response to the object signature 134. If the web object 133 is pres-  
13 ent, the method 200 proceeds with the next step. If the web object 133 is not present, the  
14 method 200 proceeds with the flow point 240.

15

16 At a step 235, the root cache 111 determines if the web object 133 is likely  
17 present at the requesting leaf cache 111. In a preferred embodiment, the root cache 111  
18 makes this determination in response to the bitmap 114 for the web object 133. If the  
19 web object 133 is likely present at the leaf cache 111, the method 200 proceeds with the  
20 next step. If the web object 133 is likely not present at the leaf cache 111, the method  
21 proceeds with the flow point 240.

22

1           At a step 236, the root cache 111 transmits the object signature 134 to the  
2   leaf cache 111.

3

4           At a step 237, the leaf cache 111 determines if the web object 133 is present  
5   in its memory or storage [112] 114, in response to the object signature 134. If the web  
6   object 133 is not present, the method 200 proceeds with the next step. If the web object  
7   133 is present, the method 200 proceeds with the flow point 240.

8

9           At a step 238, the leaf cache 111 transmits a message to the root cache 111  
10 indicating that the web object 133 is not present.

11

12          At a step 239, the root cache 111 transmits the actual web object 133 to the  
13   leaf cache 111. As noted above, the actual web object 133 is compressed for transmission  
14   and decompressed upon reception.

15

16          At a flow point 240, the leaf cache 111 is ready to serve the web object 133  
17   to the requesting client device 120. The method proceeds with the step 214.

18

1    *Alternative Embodiments*

2

3              Although preferred embodiments are disclosed herein, many variations are  
4   possible which remain within the concept, scope, and spirit of the invention, and these  
5   variations would become clear to those skilled in the art after perusal of this application.
